

CyberLock™

**IN TODAY'S IT LANDSCAPE,
NO SINGLE WIDGET CAN
CREATE AN INFRASTRUCTURE
FREE FROM RISK...**

...CyberLock combines the critical elements of People, Processes, Technology and Resiliency to form a tapestry of protection for IT infrastructures and critical data.

At OneIT, we create IT environments that let our clients sleep better at night.

In today's IT landscape, no single widget can create an infrastructure free from risk. Clients are demanding specialized expertise to protect their businesses from sophisticated cyber criminals, and most SMB's do not have in-house knowledge to address the threats, nor the time to stay up-to-date on the latest risks. **CyberLock™** from OneIT fills this void, delivering custom-designed cyber security solutions that protect the entire organization. To compliment CyberLock, OneIT also offers managed services and robust backup and recovery solutions. We have a team of engineers and technicians that can assist with day-to-day IT needs.

There are four service components that comprise **CyberLock**:

- People
- Processes
- Technology
- Resiliency

All four work together to provide a security framework for any size organization.

As layers of **CyberLock** are implemented, they work cohesively to mitigate threats

People

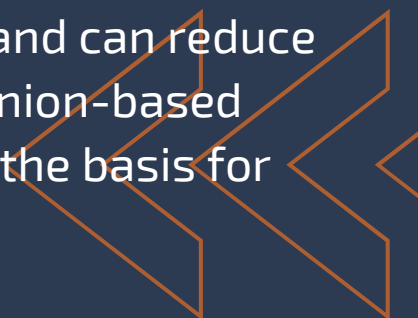

The best protection against the most common threats, is educated and empowered employees. Your people. OneIT offers email security awareness training, including phishing simulations, to help organizations manage the security problems with social engineering and ransomware attacks. As an extra measure of protection, we also offer dark web scanning, to alert organizations if any of their users' credentials are for sale on the dark web, so they can take action before it's too late.

Processes

Without documented processes to follow, security audits can reveal undesirable results that then create reactive responses. Processes fill in the gaps between organizational expectations and employee behavior, minimizing security risk, while improving morale and certainty among staff.

Process consulting and thought leadership is an important part of our IT service offering. The value to our clients, of bringing in a 3rd party firm, is a fresh and unbiased review of existing processes to find weaknesses that may be overlooked by those closest to the work performed.

We make processes more thorough, more efficient, and can reduce time spent in meetings. We assist with resolving opinion-based conflicts, and create a coaching environment that is the basis for change and learning.

Technology

OneIT's **CyberLock** technology solutions are a tapestry of services that work seamlessly together. We **identify** and analyze the entire attack surface, including the physical environment, network, applications, cloud, endpoints, and the handoffs in-between, and then monitor and **protect** each point where an intrusion could occur. When an infiltration is **detected**, we **respond** swiftly, with many responses automated to stop an attack before it can impact the organization.

If an intrusion is complex and a backup of data and servers needs to be initiated, we **recover** the environment within pre-determined RTO times. Solutions are designed to meet the specific needs of each client.

Identify

Protect

Detect

Respond

Recover

CyberLock's services are organized into coverage levels, or phases. Each phase was designed to build on the next, in a continual evolution of protection over customer assets. As security and compliance needs grow, so does our coverage.

Resiliency

Even with the best People, Processes, and Technology in place, infiltrations into your organization's environment can still occur. An uncompromised backup, combined with servers that are on standby to take over production, is the final layer of **CyberLock**. OnelT is uniquely positioned to provide extraordinary resiliency, as it is our own **DataVault™** product that we implement.

In addition to delivering a solid solution, we believe that one of our customer's greatest times of need is when they are enduring an attack or have been compromised. That's why we offer white-glove service when an environment needs to be recovered. OnelT takes on the workload to stand up the new environment, and then populates it with the most current data set. This allows our customers to focus on recovering other parts of their organization, and removes the mental stress of taking on a recovery effort.
