

DO YOU KNOW YOUR
**IT SECURITY
RISK?**

Partner with OneIT to gain knowledge about your vulnerabilities to proactively prevent IT security threats. OneIT brings the security expertise, so you can focus on other aspects of your organization.

At OneIT, we create IT environments that let our clients sleep better at night.

CyberLock™

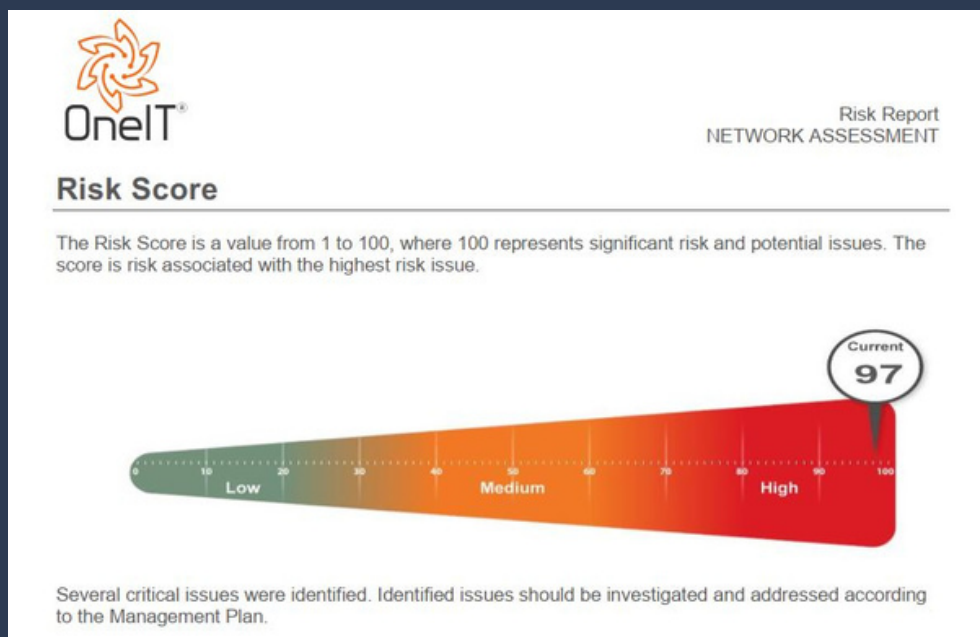

Security Assessments

OnelT provides security assessments and remediation services to organizations that are interested in lowering their cybersecurity risk profile and improving their overall security posture. This is the simplest way to discover vulnerabilities before an intrusion or data loss strikes your organization, and to ensure you are able to continue operations in the event of a cyber crime event or other disaster.

Most organizations have no ongoing visibility into IT network health. This presents several issues: Access control problems, unpatched systems and unchecked vulnerabilities that can be exploited by internal or external threat actors. By performing an IT security risk assessment, not only can OnelT identify hard-to-detect issues and come up with the necessary fixes, we can also devise and implement an action plan to track the progress of your remediation.

In less than 1 hour, OnelT's network analysis can deliver a comprehensive health report that assigns a risk score to **every aspect** of your organization's IT network, SQL Servers, Security, Exchange instances, and Microsoft 365 use.

Optionally, the assessment can also be measured against **NIST, HIPAA, PCI, GDPR, CMMC** and many other **compliance standards**, including assessments specifically for **cyber insurance** requirements. If your organization requires this level of assessment, OneIT can streamline the IT investigation, provide auditable reports, as well as a comprehensive remediation strategy against findings.

Having a trusted partner to navigate through the complexities of IT security risk assessments can help you focus on other productive tasks and bring you much-needed peace of mind. With years of expertise in IT security, OneIT can take care of your risk assessments and eliminate any hassles you may face in the process. With our expertise, you can:

- Easily identify vulnerabilities in your network
- Develop an action plan to boost IT security
- Measure your overall network health
- Make informed decisions on IT security measures

As a leader in the cyber security solutions market, not only will OneIT recommend remediation strategies based on assessment findings, we are able to implement those solutions. With over 11 years of deep experience in IT security, OneIT is also a Managed Service Provider (MSP), offering solutions from day-to-day IT support to full IT infrastructure design and implementation services.
